Measurement Tools for Oblique Imagery

The measurement tools for oblique imagery allow you to measure height, width, area, roof pitch, and angle from high resolution, up-to-date source photos.

Nearmap Oblique imagery provides a 45-degree angle view of a location. You can view Oblique imagery for each cardinal direction of the location, allowing you to measure the height and width of objects and buildings, 3D lines, such as the slope of roofs, and 3D areas, such as rooftops.

Note: Oblique imagery is available only in the New MapBrowser.
