

# Delegated Authentication

Nearmap offers Delegated Authentication to eligible customers.

Please contact your Nearmap account manager to find out if you are eligible.

## What is Delegated Authentication?

Delegated Authentication allows the Nearmap users on your account to authenticate against your user directory. e.g Active Directory, instead of using Nearmap credentials.

## The Benefits

- Password policies, such as complexity and frequency of change, are managed by your organisation.
- Your users will have one less password to remember.
- Your account will be more secure as users are less likely to share their username and password.
- New starters can be automatically setup on first login, reducing the need for you to invite new users to your account. This is available if you select what we call '[Just-in-Time Provisioning](#)'.

## Supported Active Directories

We are able to support integration with AD FS, Azure AD and OKTA. Other types may be possible on request.

## Next Steps

After your Nearmap account manager approves your eligibility to use Delegated Authentication, we will contact you to let you know what configuration we would like you to do.
