

HyperTiles

HyperTiles is no longer supported. The HyperTiles application is not available to, or licensed for use by Nearmap customers.

Since HyperTiles was discontinued, Nearmap has developed many new features that allow users to extract geo-referenced imagery and integrate Nearmap imagery with GIS and other third party applications. If you require this functionality, we suggest you look into using one of the alternatives outlined below:

[Export and Save Nearmap Imagery](#)

This tool allows image downloads in a variety of map projections at user-controlled resolutions.

[Google Earth integration](#)

It is now possible to import Nearmap imagery directly into Google Earth and Google Earth Pro, which makes it much easier to combine your own overlays with our imagery.

[KML import](#)

It's now possible to upload a KML overlay to the online MapBrowser. Consequently, in many cases it's no longer necessary to export Nearmap imagery at all.

[WMS \(Web Map Service\) Integration](#)

This allows you to feed Nearmap imagery directly into your GIS package. It provides a range of map projections directly from the server, with no reprojection necessary. This guide includes integration instructions for nine popular GIS packages.
